

MOD. 43-RRISE - Rear suspension

MOD. 93-S7 - Rear suspension

## FEATURES

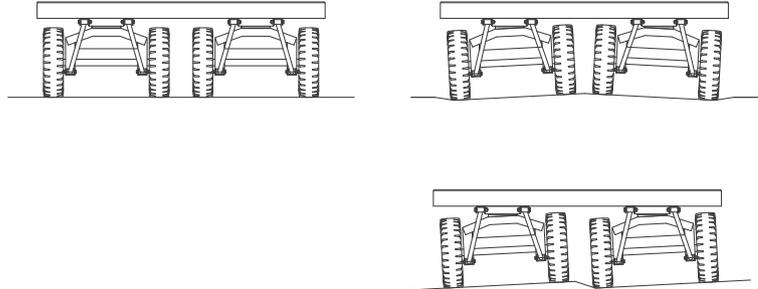

Our trailer trolleys are standard equipped with oscillating and amortized front axle.

Our particular production on a special rubber bearing is maintenance free, silent, allows the correct distribution of load and has no-torsion function for the frame. This system allows the creation of lighter frames without compromising strength.

In case of particularly non-planar paving or transportation of delicate goods, we offer our full suspension system with independent wheels.

This system, also made by rubber cushions, is maintenance free. Silent running is particularly evident (both full and empty load). It guarantees the distribution of the load, without deforming the frame, perfect stability and the goodness of transported goods, even with irregularities in the paving.

## REAR SUSPENSION

## FULL SUSPENSION
